- Results and screenshots
- Achieved objectives
- Conclusion

Introduction and Background

Minion Me is a digital service marketplace built to connect clients with verified local workers for short-term tasks and on-demand services.

Context

- Many jobs are arranged informally.
- Clients struggle to find reliable help.
- Workers lack visibility and trust signals.

Target users

- Clients seeking errands, delivery, help, or labor.
- Providers seeking jobs, ratings, and repeat income.

Why now?

- Mobile-first access broadens reach.
- Profiles and reviews improve accountability.
- Payments visibility simplify jobs closure.

Problem Statement

The informal service market is active, but it is fragmented, difficult to trust, and hard to manage at scale.

Trust gap

Clients are unsure who is reliable, available, or safe to hire.

Low visibility

Workers struggle to showcase skills, ratings, and completed jobs.

Weak coordination

Task posting, matching, updates, and follow-up are inconsistent.

Payment friction

Cash-based or ad hoc payment processes reduce accountability.

Minion Me addresses these gaps by formalizing discovery, verification, communication, and task execution in one platform.

System Objectives

Main objective

To design and develop a mobile-first marketplace that connects clients with verified service providers in a secure and efficient way.

Specific objectives

- Analyze the service-delivery gaps in the current informal market.
- Develop role-based workflows for clients and service providers.
- Support task posting, bidding or fixed pricing, tracking, and completion.
- Introduce authentication, verification, ratings, and secure payment support.
- Test the system for usability, efficiency, and reliability.

Significance of Study

For clients

Faster access to trusted workers, clearer pricing, and better task visibility.

For providers

Improved exposure, digital reputation, and more consistent job opportunities.

For institutions

A practical model for digitizing informal services using accessible technology.

For research

Demonstrates how marketplace systems can improve trust and coordination in local service ecosystems.

Literature Review

Existing service marketplaces show that trust, visibility, and platform usability strongly influence adoption.

Observed in prior platforms

- Profiles, ratings, and reviews reduce uncertainty.
- Simple job-posting flows improve completion rates.
- Clear communication and notifications keep users engaged.

Gaps in local context

- Many solutions do not fully reflect local trust and payment behaviors.
- Verification is often weak in informal hiring channels.
- Low-bandwidth usability is essential for broad access.

Implication for Minion Me

- Focus on verified users and accountability.
- Design for mobile-first, task-based interactions.
- Support integrated local payment options and clear workflows.

Methodology

The project followed the Systems Development Life Cycle (SDLC).

Tools used

- Frontend: React + Vite with Tailwind CSS
- Backend: Node.js / Express
- Database: MySQL or PostgreSQL
- Authentication and role-based access control
- Payment integration prepared for mobile money workflows

Method flow

- Gather functional and non-functional requirements
- Create interface and workflow designs
- Build user modules and dashboards
- Run validation, usability, and feature testing
- Deploy and refine based on findings

System Overview

The platform supports role-based interaction from task creation to completion and feedback.

Results: User Interfaces

Sample screenshots of Minion Me

Brief explanation:

This screen shows the Minion Me landing page, which introduces users to the platform and provides quick access to login. It is designed to give first-time visitors a clear understanding of the system while allowing registered users to securely access their accounts and continue using the platform.

Results and Achieved Objectives

Achieved objectives

- Built a structured marketplace concept for clients and service providers.
- Created role-based authentication and dashboard flow.
- Defined task management, profile, and review functionality.
- Prepared the system for secure payments and scalable future improvement.

Results and Achieved Objectives

Achieved objectives

- Built a structured marketplace concept for clients and service providers.
- Created role-based authentication and dashboard flow.
- Defined task management, profile, and review functionality.
- Prepared the system for secure payments and scalable future improvement.

Conclusion

Minion Me demonstrates how a focused digital marketplace can improve trust, coordination, and service delivery in the informal task economy.

- Formalizes access to local services
- Improves transparency and accountability
- Creates a foundation for future payment and verification enhancements

Future work can extend the system with live payments, location services, stronger verification, and analytics.

Thank you!!

Questions and comments are
welcome.
